

Dispensing Wheelbarrow

For free-flowing material

NEW

Dispensing Wheelbarrow

Screed up to 100 m²/hour

Spread grit quickly and ergonomically

The dispensing wheelbarrow is the perfect complement to our hand screeding tools. Developed by practitioners.

The idea is to spread only as much bedding material on site as needed. This starts with setting up the screeding rails and continues with the exact amount of bedding material.

German regulations ask for 3-5 cm high fillings - much less than e.g. a wheel loader bucket can dose. If individual piles are unloaded, they have to be distributed with a shovel or, for example, the Light Screeder from Hunklinger. This takes longer and is more labour-intensive than necessary.

The dosing wheelbarrow has a different approach - completely without shovels

The only aid is a (car) trailer with a tipping function and a grain pusher. Simply open it, fill the tray and drive to the screeding area.

Here you set up the screeding rails with the dosing function. Depending on the length of the screeding rails, create small piles of grit and then adjust the rails to the desired height.

In the second step, backfill the entire rails with the side outlet.

Now it's time for teamwork:

One person fills the area between the two screeding rails. Make sure you fill the width first! This is important that the second person has enough material to screed between the rails.

Ideally, you screed two or more lanes in parallel so the dispensing wheelbarrow can fill the next area and the person with the screeder has enough material to work with.
